

How to deploy an application from Bamboo

You deploy **releases** rather than directly deploying the built war. If you don't create a new release, you're releasing old code.

This covers both live and test deployment.

1. [log in to Bamboo](#)
2. [go to the plan of your choice](#) - select the **project** rather than the environment (eg Deploy LMF to Test rather than Deploy LMF)
3. create a release (button in the top right)
4. run the deploy environment (cloud icon middle-right of the page)

Unless you've killed the server, you're done.
